Q: Why creating a unix timestamp column makes my postgres query take longer? I have a database with a table that has 7 million records. It has a column named started which is a timestamp. That column is indexed so the query with order by created desc takes a bit longer (20-30 s) than query with not index (0-5 s). I would like to know why that happens and how can I avoid it?

A: Unlike other RDBMS, PostgreSQL doesn't do direct subtraction between timestamps - it performs a subtraction of

86400 by default (which comes from the number of seconds in a day). See here for more information. That means that you are adding an overhead - also known as a function call. So I would expect 1-2 seconds for 100+ queries. Division

Numbering (UNII) A list of IP address blocks as proposed by the Network Working Group under the auspices of the Internet Engineering Task Force (IETF) is available. The list is called an "IP address space outline" and is often shortened to "IP address space". IP addresses are represented by 32-bit unsigned

integer numbers, whose number of significant bits is between zero and 28. The address space is divided into units called "prefixes" or "subnetworks". Each prefix represents an internet protocol addressable subnetwork, and there are 256 possible combinations of a 32-bit integer and some number of up to 4-bit prefixes that result in an IPv4 address. The current address space in accordance with the above are as follows: The free bits of the last block (4 bits, 10000000) can be used to define intra-block subnetworks. These bits have no significance in

themselves, but are used in the process of creating IPv4 address assignments for blocks. These addresses are divided into /16, /8, and /4 blocks; there is currently no /3 block. The current assignment of prefixes for each block is as follows: See also In subnetting, 48 bits can be used to design 256 unique subnets. * **Brush Tip Shape** Once you have created a brush, you can resize it by dragging the handles on the edges. You can also add a number of settings that control the way the brush works: how hard it hits the surface of an image, how much paint is stored in the brush, what the size and color of the paint is, etc. *

Drawing Tools These tools allow you to create bitmap graphics directly on your document. The Pen allows you to draw lines and shapes, and the Eraser allows you to erase portions of an image. * **Text and Font Effects** You can use

the Text Tool (T) to edit and manipulate text, or use the Font Effects options to change fonts, styles, and more. For example, you can change the font, size, and color of text, and you can use several preset effects (e.g., Shadow, Stroke, Glow, Emboss) or create your own. * **Layer Comps** Layers allow you to stack and overlay one layer on top of another. This is useful for manipulating your composition. For example, you can place one layer on top of another to create layers of interest (e.g., body and background layers) and combine them to create a final image. *

****Eraser**** The Eraser allows you to remove portions of a layer or an entire layer. You can also use the Eraser to edit the colors, size, and type of an image. * ****Paint Bucket**** The Paint Bucket allows you to select and paint color onto a specific area of a layer. You can use the Brush tool to paint within or outside of the Paint Bucket. * ****Smart Filter**** The Smart Filter was introduced in Photoshop CS3. Using this tool, you can apply a filter to an image and get Photoshop to automatically detect areas that were subject to the filter. For example, the Star filter puts stars in an image, but the

Star filter only works in certain places where the star is actually visible. This makes it easier to apply the filter to specific areas and your overall picture. *

****Fuzz**** This is a brush that acts like a texture. It adds a bit of randomness to your texture. The Tint effect is similar to the Brush Tool and can be used to paint colors onto a layer. * ****BI**
